

Sonne: automated installation

You need: Ubuntu 24.04 LTS or Debian 13, approximately 8 GiB RAM, 15 GiB free disk, internet access and a user account with sudo.

1. Create the application and copy its ID

Open Discord Developer Portal. Choose **Create / New Application**, name it **Sonne** and create it. In **General Information**, copy your **Application ID**.

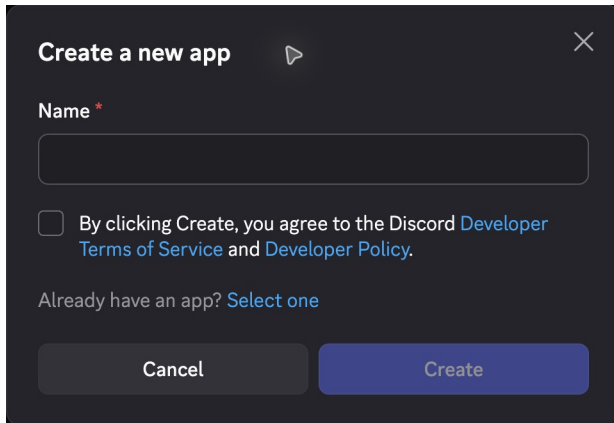

Figure 1. Create the application.

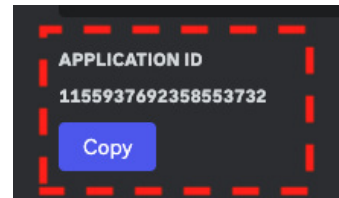

Figure 2. Copy your Application ID.
The number shown is an example.

Figure 3. Bot / Reset Token.

2. Copy the token and enable message content

On **Bot**, copy the token and keep it for the installer. Use **Reset Token** only if needed; it invalidates the previous token. Enable **Message Content Intent**; leave Presence and Server Members off.

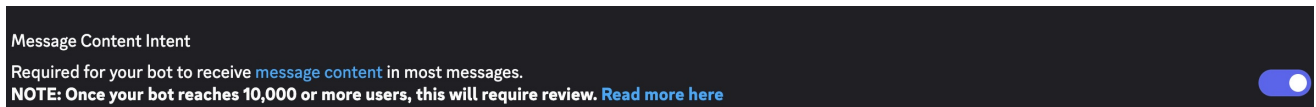

Figure 4. Enable Message Content Intent.

3. Select scopes, permissions and invite the bot

Open **OAuth2 / URL Generator**. Select bot and applications.commands. Grant **View Channels**, **Send Messages**, **Read Message History**, **Embed Links** and **Attach Files**; keep Administrator off. Open the generated invitation URL, choose your server and authorize the bot. Create a text channel named **sonne**, accessible to the bot and intended users.

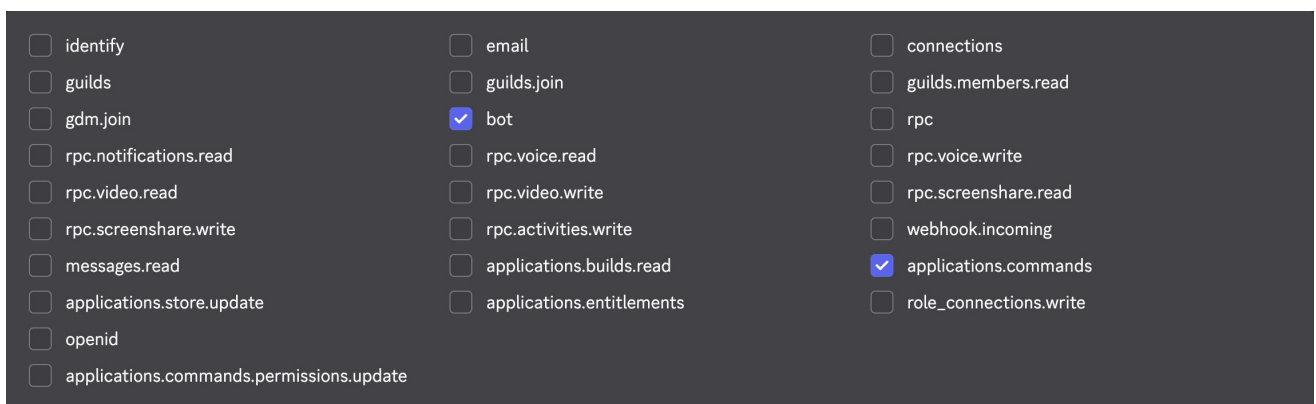

Figure 5. Select only bot and applications.commands.

Copy IDs and run the installer

4. Enable Developer Mode and copy the IDs

In Discord, open **User Settings** / **Advanced** and enable **Developer Mode**.

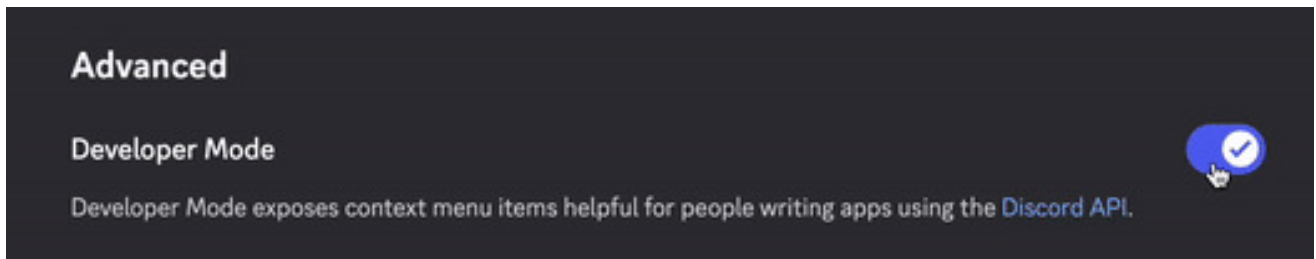

Figure 6. Enable Developer Mode.

Right-click the **server icon**, the chosen **text channel** and each **allowed user**. Copy the respective numeric ID.

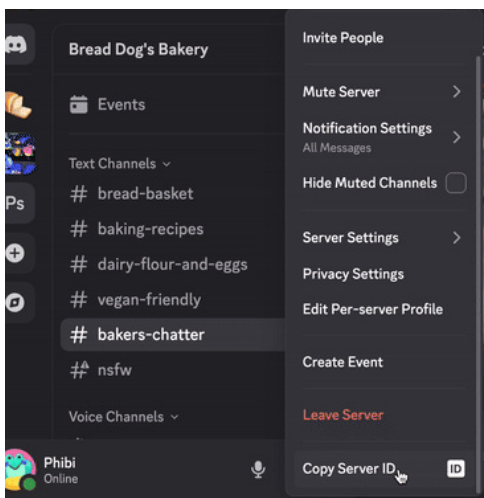

Figure 7. Copy Server ID.

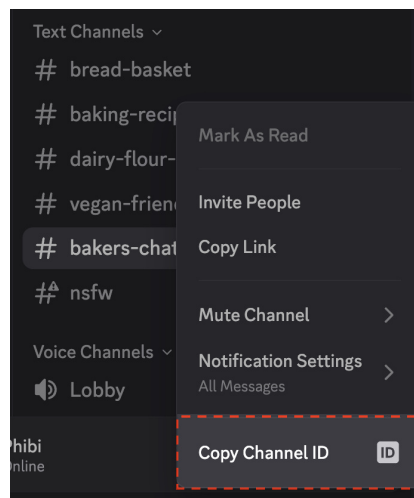

Figure 8. Copy Channel ID.

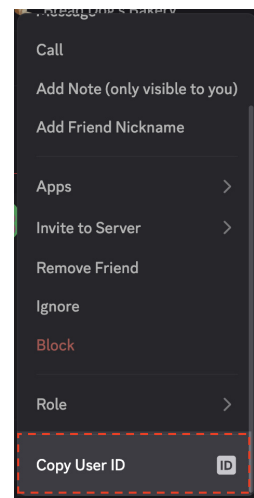

Figure 9. Copy User ID.

Use your own IDs; these screenshots show examples.

5. Download and run the installer

In the Ubuntu or Debian terminal, clone the repository and run the installer as your normal user:

```
sudo apt-get update
sudo apt-get install -y git
git clone https://github.com/Krabbens/sonne.git ~/sonne-installer
cd ~/sonne-installer
bash scripts/install-sonne.sh
```

Enter your sudo password when requested. At the prompts, enter:

1. Bot token (hidden while typing).
2. Application ID.
3. Server ID.
4. Channel ID.
5. Allowed User IDs, separated by commas.

Wait for the installer to finish. If a download is interrupted, run the same command again.

Check that the bot works

6. Send a message

In the allowed channel, from an allowed account, mention the bot:

```
@Sonne Reply with exactly: sonne-ok
```

Wait for a visible reply; the first request can be slow.

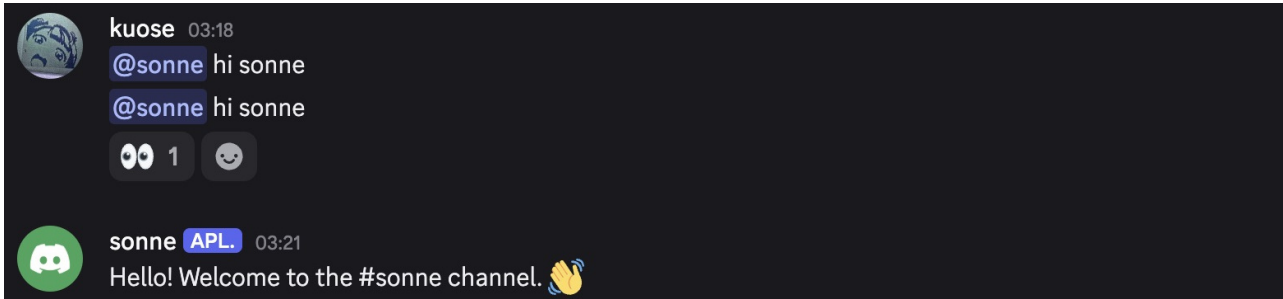

Figure 10. Example reply from the running bot.

7. Test an image and a file

Attach `examples/vision-check.png` from `~/agents/sonne`. Ask the bot to read the large label and identify the red shape. Expect **SONNE 42** and a **red square**.

Then ask it to create and read a new test file:

```
@Sonne Create files/smoke.txt containing exactly SONNE FILE OK.  
Read it back.
```

In the Linux terminal, verify the saved file:

```
cd ~/agents/sonne  
cat workspace/files/smoke.txt
```

8. If the bot does not reply

Check the token, IDs, channel permissions and Message Content Intent. In the Linux terminal, inspect service status and recent logs:

```
cd ~/agents/sonne  
docker compose ps  
docker compose logs --tail=100 openclaw
```

If Docker reports a permission error, log out of Linux and log back in.
